WARNING

Do not use Gates Corporation belts, pulleys or sprockets on any aircraft propeller or rotor drive systems or in-flight accessory drives. Those Gates products are not designed or intended for aircraft use.

CAUTION

Use Gates products only on applications specified in Gates literature. Install and maintain products according to the vehicle manufacturer's recommended procedures and with recommended tools. Failure to follow these instructions could result in injury or property damage. Gates disclaims all liability due to failure to follow these instructions.

Limited Warranty for the Life of the Merchandise

Merchandise is warranted to be free from defects in material or workmanship for the life of the merchandise. Damages from misuse, abuse or gradual wear from normal use are excluded from this warranty. Gates Corporation will, at its option, replace or repair any merchandise proved defective in material or workmanship, or both, during the warranty period. This is the exclusive remedy. For warranty service please contact the Automotive Labor Claims Department (Mail Code BN-A1), Gates Corporation, 1551 Wewatta Street, Denver, Colorado 80202. ALL OTHER EXPRESS WARRANTY AND IMPLIED WARRANTIES, INCLUDING THOSE OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, HEREBY IS DISCLAIMED TO THE EXTENT SUCH EXCLUSION IS PERMITTED BY LAW. LIABILITY FOR CONSEQUENTIAL, INDIRECT, SPECIAL, OR INCIDENTAL DAMAGES HEREBY IS DISCLAIMED TO THE EXTENT SUCH EXCLUSION IS PERMITTED BY LAW. Some states do not allow the exclusion or limitation of incidental or consequential damages, and some states do not allow limitations on how long an implied warranty lasts, so the above limitation and exclusion may not apply to you. This warranty gives you specific legal rights and you may also have other rights, which vary from state to state.

We hereby certify that the goods will be produced in compliance with requirements of Sections 6 and 7 of the Fair Labor Standards Act of 1938, as amended, and of regulations and orders of the U.S. Department of Labor issued under Section 14 thereof.

Automatic Belt Tensioners:

Why cars have them and where to get them

Over 100 million vehicles use automatic belt tensioners. Tensioners, like any other part, don't last forever, and automotive technicians will be replacing more and more of them.

The vast majority of vehicles with serpentine belts often have an automatic tensioner. Tension is provided by a powerful spring located within a small canister-like housing and tensioning arm to which a pulley is attached. The arm pivots around the spring housing and generates a constant belt tension.

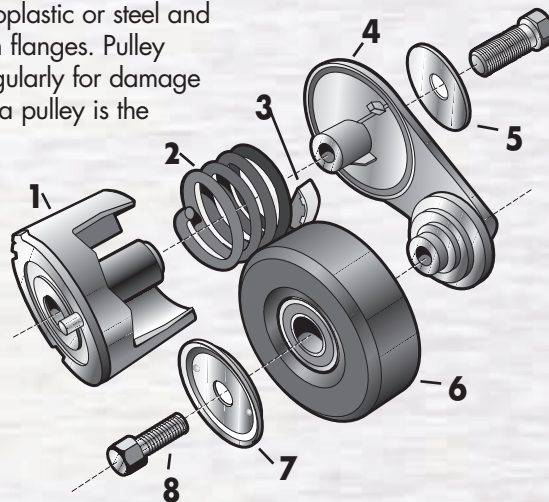

Tensioners are designed into the belt drive system for several reasons:

- Proper tension is maintained throughout belt life.
- Reduce maintenance by eliminating need to retension belts on a periodic basis.
- Provides consistent and correct belt tension, thereby increasing bearing life of accessories.
- Increase belt life because belt is not over or under tensioned.
- Prevent belt slip. A belt that slips is not only noisy but can also cause accessories to not function properly.

How does a tensioner work?

The tensioner is a spring-loaded device consisting of eight basic parts.

- 1. Base:** stationary part of the tensioner that is bolted to engine block or other accessories. Base designs vary. Some base components are very complicated and may include bracketry or conduits that carry engine coolant.
- 2. Tension Spring:** preloaded at the factory. It provides force to tension the belt.
- 3. Damping Mechanism:** a composite mechanism that smooths system vibration. Tensioners with worn out damping mechanisms need to be replaced.
- 4. Arm:** connects spring to tensioner pulley. Usually an aluminum casing.
- 5. Sealing Disk:** attaches base to arm and prevents internal contamination.
- 6. Pulleys/Bearings:** are thermoplastic or steel and may be grooved, flat or flat with flanges. Pulley surfaces should be inspected regularly for damage or wear. The key component of a pulley is the bearing. For a pulley to function properly, the bearing must be properly lubricated. The most frequent cause of pulley failure is loss of lubrication in the bearings. Do not attempt to put new bearings in an old pulley.
- 7. Dust Shield:** protects bearing from elements.
- 8. Bolt:** connects pulley to arm.

A belt length variation gauge is built into most tensioners. The gauge indicates belt length. It consists of a pointer and either two or three marks indicating the range of tensioner movement. Minimum belt length, ideal length and full take-up length are usually indicated on the gauge. The gauge window is located on or along the break between the base and tensioner arm. As a belt wears with age, the tensioner automatically moves to keep belt tension constant. As this happens, the length gauge pointer will move toward maximum length. When the pointer is within 5% of the maximum belt length mark, the

tensioner is out of its useful range and the belt should be replaced. Belt wear often results in squeals and loose appearance.

Careless belt replacement can also result in tensioner failure. A tensioner that is allowed to snap back to its original position can crack and break. In addition, a belt that is too short can cause the tensioning arm to break.

Note: A tensioner cannot be rebuilt since internal parts are not available. Never try to disassemble a tensioner unit. Injury may result.

OE Fit. Not Retrofit.

DriveAlign™ tensioners fit and perform like the original.

Only DriveAlign automatic tensioners look and install exactly like the original equipment part. No more hunting for OE replacement parts. No more worries about inferior “universal fit” brands costing you money and valuable customers. No more time-consuming grinding or gluing during installation. Our tensioners bolt on just like the original tensioner. With DriveAlign tensioners, you’ll get performance that’s equal to or better than the original. In fact, our engineers analyze the early failure modes of OE designs and make any necessary adjustments to improve quality.

What are the advantages of a DriveAlign automatic tensioner?

- Assures constant and correct belt tension, eliminating the need to re-tension
- Dampens system vibrations within the belt accessory drive system
- Maintains correct belt alignment
- Prolongs life of other accessory drive components
- Reduces belt noise and wear by preventing belt slip
- Indicator of correct belt length
- Provides belt replacement gauge

The Technical Truth About Belt Tensioners

Round Torsional Spring vs. Flat Spring Technology

DriveAlign's Round Torsional Spring

- Even rotational load. Offers resistance to compressive force.
- Tighter dimensional tolerances for better output control.
- Coil diameter tension remains constant across a wider range of motion.
- Creates no heat build up. Less heat means longer tensioner life.
- Fewer stress points to weaken tensioner.
- Vibration and noise free. Space between coils keeps them from rubbing together.
- Damping mechanism absorbs shock loads for stable operation. Damping remains constant throughout life of tensioners.
- Not affected by contaminants because of the spacing between the spring coils.
- Damping mechanism is internal and protected from contaminants.

Competitor's Flat Spring

- Uneven resistance through distributed concentric coil.
- Less dimensional tolerance control. As a result, flat spring dimensions may vary significantly.
- Tension varies because flat design operates within a narrower range rather than operating across all areas of the spring.
- Builds up heat from friction caused by greater surface contact of spring coils. Heat increases tensioner component wear and failure.
- More stress points along spring edges that can weaken tensioner, resulting in spring fatigue.
- Close-wrapped coils vibrate and become noisy as a tensioner wears.
- Damping mechanisms are not included on most aftermarket flat spring tensioners. This means shorter belt life, more vibration noise, belt slip, and ultimately, more returns.
- Subject to failure due to contamination because dirt and grime lodge between coils. Particles become trapped, causing tensioner spring to seize.
- Damping disks are external and subject to wear by contamination.

DriveAlign Automatic Accessory Tensioner Replacement Tips:

Always disconnect battery and wear appropriate safety equipment before performing any work under the hood.

- 1 Always refer to vehicle manufacture's guidelines for installing tensioner and pulleys.
- 2 Refer to OE belt routing diagram located under hood or sketch routing before belt removal to provide easy belt installation.
- 3 Observe the method for lifting the tensioner away from the belt.
General techniques for withdrawing the tension from belt:
 - 3/8" or 1/2" square cavity on tensioner for breaker bar.
 - Pulley bolt is designed to be used as a lifting feature if cavity is not present. Use breaker bar and socket of proper fit. Bolt thread will be right or left in order to not loosen during lifting. Double check socket size to ensure proper fit to bolt.
 - Cast lug is utilized on some models. Lifting is performed by using an open-end wrench.

Proper seating of wrench or breaker bar is essential, otherwise slippage can occur and cause injury. Use our professionally-designed tools on the following page to assist in the removal and installation of belts and tensioners.

- 4 Lift tensioner arm away from the belt.
- 5 Remove belt from smallest pulley.
- 6 Slowly lower tensioner arm into original position.

Rapid release can cause injury and/or damage to tensioner and engine.

- 7 Remove the tensioner mounting bolt and washer (if supplied) for reinstallation.
- 8 Install new tensioner in the reverse order of removal.
 - Additional instructions are supplied with each tensioner. Please review these instructions before attempting to install the new tensioner.
- 9 Install belt in the reverse order of removal.

Ensure the belt is properly seated in all pulley grooves and routed correctly. Start engine for 30 seconds, shut off, and recheck that the belt is seated and tracking properly.

Torque Specifications:

When OE mounting bolt torques are unavailable, the following torques are recommended for the bolt sizes commonly used.

Thread Size/Type	Recommended Torque (ft. lbs)
8mm	16 – 24
* 3/8 inch	24 – 35
10mm	40 – 48
* 12mm	60 – 70

*usually found on pre-1990 vehicles

Tools

DriveAlign™ Laser Alignment Device

Quickly identifies two most common types of pulley misalignment—parallel offset and angular—that reduce belt and pulley service life and produce unwanted noise. Simply position tool within grooves of pulley and aim laser beam at opposite pulley. Exclusive, patented tool is compatible with all automotive serpentine belt drives. Lightweight, easy-to-use tool includes special laser enhancement glasses for easy viewing in all light conditions. Comes with high-impact resistant carrying case.

Serpentine Ratcheting Wrench Set

Provides fast way of releasing tension on serpentine belt drives. Reversible, 21-tooth ratcheting heads on each end allow for better tool positioning and more swing than standard serpentine belt wrenches. No adapters to get lost or fall out. Wrenches are 21-1/2" long, 6" longer than competitive designs for increased leverage. Includes eight sizes for maximum application coverage: 13mm, 14mm, 15mm, 16mm, 17mm, 3/8", 1/2" and 3/4".

Heavy-Duty Ratcheting Serpentine Wrench

Only 13" long, wrench is designed for restricted areas where radiator hoses, charged air cooler pipes, hydraulic lines and frame rails often interfere with maintenance. Has 27-tooth ratchet for better tool positioning and more swing than standard serpentine belt wrenches. Reversible ratchet head is only 1" thick to fit between tensioner face and fan blades like on series 60 Detroit Diesel and Caterpillar engines. Great for buses and delivery vans where doghouse or engine shrouding gets in the way of work area. Works on any serpentine belt tensioner with a 1/2" square drive opening, including engines made by Caterpillar, Cummins, Detroit Diesel, International, Navistar, Mack and Volvo.

Serpentine Belt Tension Relief Tool

Provides necessary leverage and clearance to release spring pressure and move tensioner pulley arm when removing and installing serpentine belts. New 3-bar design includes seven sockets (13mm, 14mm, 15mm, 16mm, 18mm, 3/8" and 1/2").

Serpentine Belt Installation Tool

Reduces time and frustration of installing serpentine belts on hard-to-reach drives. Two-pin hook end holds belt for precise placement while grooved handle provides necessary grip to maneuver tool around pulleys. The 25" tool is also handy for installing difficult-to-reach timing and V-belts.

Accessory Drive Idler/Tensioner Pulleys

For Passenger Cars & Light Trucks

There is no need to rely on new car dealers for pulleys. DriveAlign® pulleys are in your local parts store.

DriveAlign[®] pulleys are:

- Made of steel or premium thermoplastic for longer wear life and higher load capacity;
- Available for both backside and groove-side applications;
- Precise dimensional tolerance for smooth operation and long life;
- Corrosion-resistant coating for better durability and longer life;
- Designed to operate under severe conditions which provide greater reliability;
- Made with premium service-free bearings and seals that can operate at higher temperatures providing 10 times the expected life of other bearings.

NOTE: Always check for interference before re-installing the washer. In some cases, the washer may not fit in the new pulley. If this is the case, it is not necessary to replace the washer. The bearing in the idler is already greased and sealed. Tighten the pulley bolt and reinstall the tensioner. No adjustment is required for belt tension.

Alternator Decoupler Pulleys

What's an Alternator Decoupler Pulley?

Just like a standard alternator pulley, an alternator decoupler pulley drives the alternator in combination with the serpentine belt. However, a decoupler pulley has a special internal one-way bearing that allows the

pulley to rotate free in one direction. More and more new vehicles are equipped with alternator decoupler pulleys because of the many performance advantages they provide.

How does an Alternator Decoupler Pulley function?

Alternators can rotate at speeds up to 3 times faster than the engine. If your engine runs between 1,000-6,000 rpm's, the alternator can be rotating 3,000-18,000 rpm's! During normal operating conditions, engine speeds are constantly changing. Each time the transmission shifts, engine rpm's change significantly. Likewise, during hard acceleration, braking, and even engine shut-off, rpm's change dramatically. During these times, the belt must reduce the alternator speed and often absorbs a shock from today's high output alternators, which have substantial mass. This can lead to unwanted noise, vehicle vibration and reduce belt and component life. When a failure of this system occurs, customers can complain about belt squeak when decelerating, unusual interior vibrations or even a shudder in the steering wheel. Believe it or not, the cause can be the alternator!

An alternator decoupler works like a "one-way" pulley. When rotated in one direction (normally clockwise) it connects to the alternator shaft and rotates the alternator. But, during deceleration, it disconnects from the shaft allowing the alternator to freewheel. How does it do this? A special bearing known as a Sprague clutch is mounted in the pulley. By allowing the alternator mass to freewheel during rapid decelerations, the alternator decoupler pulley reduces strain on the belt, tensioner and other accessories. It also reduces unwanted noise and vibration, and can even improve fuel mileage. As a result, alternator decoupler pulleys are critical to proper vehicle performance.

How do I know it is failing?

Often vehicle owners will complain of unusual belt noises, steering system shutter or unusual vehicle vibrations. First, determine if the vehicle has an alternator decoupler pulley. Consult the vehicle shop manual or this catalog to help in identification. Then inspect for the following failure indicators:

- Rotate the pulley. It should lock-up. When turning the alternator in one direction and turn freely in the other.
- Feel for roughness when rotating the pulley in the freewheeling direction.
- Check for excessive movement in the pulley when rocked back and forth.
- Check pulley flanges and belt grooves for damage (chips, dents, etc.)

If any of these failure modes appear, replace the pulley. Also remember to inspect the pulley when replacing the drive belt or the alternator. And when necessary, replace your alternator decoupler pulley with DriveAlign! DriveAlign alternator pulleys are designed and manufactured to the same specifications as the OE. Do the job right – use DriveAlign!

Heavy-Duty Automatic Accessory Drive Belt Tensioners & Idler Pulleys

Diesel engines are inherently harsh on automatic tensioners. They literally shake and vibrate ordinary designs to a premature end.

But not DriveAlign heavy-duty tensioners. They're engineered to exceed demanding OEM requirements with such features as:

- Heavy-duty cast aluminum base and arm for extra strength and accurate alignment
- High-tech composite damping system to reduce vibration — maximizing tensioner and belt life
- Precision double row pulley bearing which reduces friction and extends life

In fact, in laboratory tests when tested under extreme peak-to-peak vibration and contamination tests DriveAlign heavy-duty tensioners lasted up to three times longer than competitive aftermarket tensioners.

Best of all, the DriveAlign heavy-duty tensioner line gives you maximum coverage with minimal inventory.

- 1 Labyrinth Seal** — Prevents contamination of internal parts for maximum durability and service life.
- 2 Machined Steel Pulley** — Reduces surface wear while shielding internal bearings from outside contaminants.
- 3 Double Row Bearings** — Twin rows of bearings minimize friction for reduced bearing wear and noise.
- 4 Optimized Components** — Engineered for minimum unit weight but maximum strength and durability.
- 5 Patented Design** — Provides superior belt alignment and tension for improved drive efficiency and life.
- 6 Round Spring Wire** — Chrome-silicon torsion spring for less flex-fatigue than flat-wire designs.
- 7 Patented Damping Mechanism** — Provides maximum stability — reducing vibration and increasing tensioner life.

IMPORTANT: PLEASE NOTE. To select correct replacement parts, it may be necessary to identify the code character for the engine by looking at the VIN (Vehicle Identification Number) located on the dash panel. For 1981 and newer cars, refer to the 8th digit of VIN for the correct engine code.		V-6 3.8 L ENG.		V-8 4.6 L ENG.

Tensioner Pulley	38008	IMPORTANT: PLEASE NOTE. To select correct replacement parts, it may be necessary to identify the code character for the engine by looking at the VIN (Vehicle Identification Number) located on the dash panel. For 1981 and newer cars, refer to the 8th digit of VIN for the correct engine code.		C & K SERIES PICKUP

IMPORTANT: PLEASE NOTE. To select correct replacement parts, it may be necessary to identify the code character for the engine by looking at the VIN (Vehicle Identification Number) located on the dash panel. For 1981 and newer cars, refer to the 8th digit of VIN for the correct engine code.		RAM SERIES PICKUP		Tensioner Pulley; L.D. Pick-up	38016

Changeover Listing

DriveAlign® Automatic Belt Tensioner, Pulley & Decoupler Numbers

Showing Competitive Numbers with Our Corresponding Stock Numbers

The DriveAlign® numbers shown in the following listings were determined by comparing the applications and physical characteristics of the product. This is a guide for changing over stocks to DriveAlign® numbers, and does not mean that the competitive number shown will fit all applications recommended for the DriveAlign® number. If a customer asks for a product to replace a product of another brand, do not use this list. Ask for the make, model, year and engine size on which it is to be used, and refer to the alphabetical listing to determine the proper replacement.

Troubleshooting Front End Accessory Drives

To accurately check for noise symptoms the system must be loaded:

- Air conditioner on full
- Lights on
- Wheels turned 3/4" to the left or right

- Air conditioner fan on full
- Defroster on

Symptom	Probable Cause	Corrective Action
---------	----------------	-------------------

Appearance/Worn Pulley

For steel idlers, paint has worn off the belt tracking area.	1. This is a normal condition.	No corrective action required.
Plastic idler pulley appears to be worn on belt tracking area.	1. Extreme environmental wear (i.e., heat, water, stones).	Replace idler.
On plastic idlers, pulley is chipped.	1. Stone damage. 2. Faulty installation practices.	Replace idler only if chip is in belt tracking area.
On steel idlers, pulley has been marred in belt tracking area.	1. Stone damage. 2. Faulty installation practices.	Replace idler only if deformation is in belt tracking area.
Pulley shows signs of corrosion.	1. Coating on pulley has worn off. NOTE: It is normal for coating to wear off belt tracking area.	Replace idler.
Idler has excessive wobble (free rock).	1. Bearing failure. 2. Excessive load on pulley. 3. Belt is not tracking properly over pulley.	Replace idler.

Tensioner Appearance

Tensioner arm is cracked.	1. Excessive force is used in removal. 2. Long-term fatigue failure. 3. Tensioner is allowed to snap back into stop position.	Replace tensioner.
Tensioner vibration during engine idle is excessive.	1. Tensioner damper is worn. 2. Accessory is out of round.	Replace tensioner.
Grease appears to be leaking out of the bearing.	1. Grease purge. 2. Seal degradation. 3. Excessive radial internal clearance in bearing.	Replace idler.
Bearing seal is missing or damaged. Tensioner tilted or misaligned or gap exists between tensioner arm and base.	1. Worn pulley. 2. Environmental damage (i.e., heat, water, stones). 3. Poor tensioner mounting.	Replace idler. Replace tensioner.

Loose, Sticking or Seized Tensioner

Tensioner does not operate smoothly.	1. Bearing surface damaged. 2. Damper damage. 3. Spring is broken.	Replace tensioner.
Pulley is seized and will not rotate freely.	1. Bearing is damaged.	Replace idler.
Pulley does not rotate smoothly or has a sticky feel to it when spun.	2. Radial internal clearance in bearing is too low. 3. Bearing fit in pulley is tight.	Replace idler.
Pulley and bearing have relative motion.	1. Bearing is not being constrained in idler pulley.	Replace idler.

Noise

Belt squeal noise.	1. Belt worn or stretched to maximum take-up length of system. 2. Tension force not sufficient.	Check belt length window. If belt is correct length, replace tensioner.
Tensioner clatters or rattles during engine operation.	1. Damper is worn. 2. Bearing surfaces within tensioner are worn.	Replace tensioner.
Belt chirping due to system misalignment.	1. Pulley or tensioner are worn. 2. Cracks in tensioner base or arm. 3. Mounting bolts loose.	Replace worn or cracked tensioner. Tighten loose bolts to vehicle manufacturer's specifications. Check entire system for misalignment.
Pulley makes a high-pitched whine or hooting noise after the engine is started. Noise lasts up to three minutes.	1. Worn bearing. 2. Bearing fit to pulley is incorrect.	Replace idler.
Pulley exhibits noise during normal operation.	1. Bearing is not functioning properly.	An idler pulley is normally very quiet. Replace idler.
Pulley and bearing assembly rattle when shaken.	1. Bearing cage is broken. 2. Balls in bearing are loose. 3. Bearing is contains no lubricant.	Replace idler assembly.

Bearing Noises/Bearing Hoot

Continuous hissing and grinding noise that gets louder as engine RPM increases.	1. No bearing lubricant.	Use an automotive stethoscope to locate the source of the noise. Turn engine off and hand spin pulley. If it's hard to turn, feels rough or rattles, replace pulley assembly.
Continuous growling noise that changes to a whine as engine RPM increases.	1. A bearing is about to fail. 2. Excessive idler pulley wobble. 3. Contamination of other fluids into pulley seal.	Visually inspect bearing in question for signs of heat "bluing" of metal or grease purge. Check for bracket movement due to loose or misaligned fasteners. Check for proper belt mounting.
Hoot noise that occurs at low temperature (below -20° F).	1. Insufficient or improper bearing grease.	If belt has glazing, cracks or other visible defects, replace belt.

Caution: Replace entire idler assembly or tensioner. Do not just replace the pulley.

Belt Tracking

Belt does not track properly on idler belt tracking surface.	1. Bearing is not fixed to the correct depth in pulley. 2. Belt tracking surface is not square to bearing mounting surface. 3. Pulley tracking surface is tapered. (Crowning or bowing of belt tracking surface is sometimes intentional.)	Replace idler.
